

ANALYZING TAMARAWS' TRAVEL TIME & PROBABILITY DISTRIBUTIONS

BACKGROUND & VARIABLE OVERVIEW

- **Selected Variable:** Student Travel Time to Campus (in minutes).
- **Sample Size:** $N = 50$ Far Eastern University students.
- **Objective:** Map travel times into a frequency distribution, construct a normal distribution model, and evaluate real-world commuting patterns.

FREQUENCY TABLE

Mean(μ) = 62.8 minutes

Standard Deviation (σ) = 34.71693112

Commute Time	Frequency (f)	Relative Frequency (%)	Cumulative Frequency	Midpoint (x)
10-29	8	0.16	8	19.5
30-49	14	0.28	22	39.5
50-69	9	0.18	31	59.5
70-89	2	0.04	33	79.5
90-109	9	0.18	42	99.5
110-129	8	0.16	50	119.5

FINDINGS

Histogram

Boxplot/Candlestick

PRESENTATION OF FINDINGS

Boxplot of Students' Travel Time

Red diamond = mean (62.8 min); no outliers detected

Normal Distribution Curve

a. Symmetric Distribution

b. 1σ : 28 to 97 minutes

travel time

c. No outliers

REAL LIFE IMPLICATIONS

- Impact on Academic Performance & Well-being
 - Cognitive Fatigue & Morning Readiness
 - Cumulative Time Loss
 - Attendance & Tardiness
 - Reduced Extracurricular & Co-Curricular Participation
- Infrastructure Dynamics
 - Socio-Economic Variance
- Safety & Environmental Exposure
 - Vulnerability to Extreme Weather & Microclimates
 - Off-Peak Safety Risks

RECOMMENDATIONS

For Students (Individual & Study Strategies)

- Time-Buffering via Standard Deviation
- Active Commute Optimization
- Strategic Class Scheduling

For University Administration & Educators

- Flexible Morning Attendance Window
 - Expanded Campus Resting & Study
- ### Urban Infrastructure & Commuter Safety

THANK YOU!
